Agenda

Background
Screening
Diagnosis
Treatment
Where do we go from here...
Background

Persistent CORE Symptoms
Impaired function
Comorbidities which complicate diagnosis
Results of ADHD
ADHD

Heterogeneous behavioral syndrome of CORE symptoms

Hyperactivity
Impulsivity
Inattention

One symptom can dominate
Symptoms

- 30% of children with ADHD have persistent symptoms into adulthood
- 15% retain most of their symptoms
- 3-4% of adults meet DSM-IV criteria for ADHD
  - 20-50% of adults have traits but not sufficient for diagnosis
- Symptoms of hyperactivity and impulsivity tend to decrease
  - Attention deficit most likely CORE symptom to persist

Function

Manifestations of CORE Symptoms

- Difficulty getting started on tasks
- Variable attention to details
- Difficulties with self-organization and with prioritization
- Poor persistence in tasks that require sustained mental effort
- Impulsivity and low frustration tolerance (to varying degrees)
- Hyperactivity (less salient symptom in adults)
- Chaotic life-styles
- Associated psychiatric comorbidities (in some patients)
- Disorganization
- Substance abuse (in some patients)
Common Comorbidities
More than 80% have comorbidities
3-7 fold rate of comorbidities

Anxiety
Depression
Antisocial personality disorder
Neurodevelopmental disorders
Bipolar disorder
Substance misuse
Mood disorders
Sleep disorders

Results of Untreated ADHD

• Lower paying jobs, more job changes, trouble with finances
• More relationship issues
• More sexually transmitted diseases and unwanted pregnancies
• More psychological distress
• Higher rate of substance abuse
• Higher incidence of criminal activity
Screening and Primary Care Work Up

Adult patients suspected of having ADHD

Screening Tools
Differential Diagnosis
Recommendations
Symptom Screening Tools

Pilot Adult ADHD Self-Report Scale (ASRS-v1.1)

Part A (Primary Screening)
- 0-3 marks in shaded boxes
  - ADHD unlikely; no need for additional evaluation
- 4+ marks in shaded boxes
  - ADHD possible; need for additional evaluation

Part B
- Additional cues into symptoms
- Will review in Diagnosis

Adult ADHD Self-Report Scale (ASRS-v1.1) Symptom Checklist

## Adult ADHD Self-Report Scale (ASRS-v1.1) Symptom Checklist

**Patient Name** | **Today’s Date**
--- | ---

Please answer the questions below, rating yourself on each of the criteria shown using the scale on the right side of the page. As you answer each question, place an X in the box that best describes how you have felt and conducted yourself over the past 6 months. Please give this completed checklist to your healthcare professional to discuss during today’s appointment.

---

Differential Diagnosis

• Comorbidities
  • Depression (PHQ-2 / PHQ-9)
  • Alcohol and/or drug misuse or diversion (AUDIT / DAST-10)
  • Anxiety (GAD-7)
• Rule out other medical diagnoses
  • hearing impairment, thyroid disease, lead toxicity, hepatic disease, sleep apnea, and drug interactions.
• Medications that impact attentiveness
  • steroids, antihistamines, anticonvulsants, caffeine, and nicotine

Recommendations

- All initial primary mental health evaluations of adults should include screening for ADHD
  - More common than Schizophrenia, Bipolar Disorder, and Generalized Anxiety Disorder
  - Genetic component to disorder: 15-40%

Joseph Biederman
Chief of the Clinical and Research Programs in Pediatric Psychopharmacology and Adult ADHD
Massachusetts General Hospital
Professor of Psychiatry at the Harvard Medical School
Diagnosis

General Approach
DSM-IV vs. DSM-V
Requirement of Diagnosis
Diagnostic Approaches
Improvements
General Approach

Diagnosis is typically made by a mental health provider or primary care provider

Adult Diagnosis based on:

- comprehensive clinical and psychosocial assessment
- Impact of symptoms on functioning
- Developmental history
- Review of rating scales
DSM-IV-TR Diagnostic Criteria

- 6 or more symptoms in domains 1 or 2
- Impairment was present before age seven years.
- Present in two or more settings (at school/work and at home).
- Clinically significant impairment in social, academic, or occupational functioning.
- The symptoms do not occur exclusively during the course of other psychotic disorder and are not better accounted for by another mental disorder

Development was focused on children and adolescents
Table 1 - DSM-IV diagnostic criteria for ADHD

A. Either 1 or 2
   (1) six (or more) of the following symptoms of inattention have persisted for at least 6 months to a degree that is maladaptive and inconsistent with developmental level:

   **Inattention:**
   a) often fails to give close attention to details or makes careless mistakes in schoolwork, work, or other activities
   b) often has difficulty sustaining attention in tasks or play activities
   c) often does not seem to listen when spoken to directly
   d) often does not follow through on instructions and fails to finish schoolwork, chores, or duties in the workplace (not due to oppositional behavior or failure to understand instructions)
   e) often has difficulty organizing tasks and activities
   f) often avoids, dislikes, or is reluctant to engage in tasks that require sustained mental effort (such as schoolwork or homework)
   g) often loses things necessary for tasks or activities (e.g., toys, school assignments, pencils, books, or tools)
   h) is often easily distracted by extraneous stimuli
   i) is often forgetful in daily activities

   (2) six (or more) of the following symptoms of hyperactivity-impulsivity have persisted for at least 6 months to a degree that is maladaptive and inconsistent with developmental level:

   **Hyperactivity:**
   a) often fidgets with hands or feet or squirms in seat
   b) often leaves seat in classroom or in other situations in which remaining seated is expected
   c) often runs about or climbs excessively in situations in which it is inappropriate (in adolescents or adults, may be limited to subjective feelings of restlessness)
   d) often has difficulty playing or engaging in leisure activities quietly
   e) is often "on the go" or often acts as if "driven by a motor"
   f) often talks excessively

   **Impulsivity:**
   g) often blurts out answers before questions have been completed
   h) often has difficulty awaiting turn
   i) often interrupts or intrudes on others (e.g., butts into conversations or games)

B. Some hyperactive-impulsive or inattentive symptoms that caused impairment were present before 7 years of age.
C. Some impairment from the symptoms is present in 2 or more settings (e.g., at school [or work] or at home).
D. There must be clear evidence of clinically significant impairment in social, academic, or occupational functioning.
E. The symptoms do not occur exclusively during the course of a pervasive developmental disorder, schizophrenia, or other psychotic disorder and are not better accounted for by another mental disorder (e.g., mood disorder, anxiety disorder, dissociative disorder, or personality disorder).
Changes in the DSM-V

- Examples have been added to the domain criterias
- “Several” symptoms required in each setting
- “Several inattentive or hyperactive-impulsive symptoms were present prior to age 12”
- Subtypes have been replaced with presentation specifiers
- Comorbid diagnosis with autism spectrum disorder
- Adult threshold for ADHD is now five symptoms
- Finally, ADHD is now a "neurodevelopmental disorders"
  - brain developmental correlates with ADHD

Clinical Diagnosis

- Assess current clinical and psychosocial status
  - Severity in multiple settings
    - Adult ADHD Rating Scale-IV (Barkley Adult ADHD Rating Scale [BARRS IV])
  - Establish developmental history of ADHD
    - If no diagnosis prior to 12 years of age
      - Retrospection of 18 DSM-IV-TR criteria
      - Collect observer reports
  - Psychiatric history
    - Rule out other disorders or to establish the presence of comorbid disorders
# BAARS-IV: Self-Report: Current Symptoms

**Name:**

**Sex:** (Circle one) Male   Female   Age: ____________________________

**Date:** ____________________________

**Instructions**

For the first 27 items, please circle the number next to each item below that best describes your behavior **DURING THE PAST 6 MONTHS**. Then answer the remaining three questions. Please ignore the sections marked “Office Use Only.”

Office Use Only (Section 4)

Total Score ____________  Symptom Count ____________

**Total Scores for Entire Scale:**

- Sum of Sections Raw Scores 1–3—Total ADHD Score ____________
- Section 1 Symptom Count ____________
- Sum of Sections 2 and 3 Symptom Counts ____________
- Total ADHD Symptom Count ____________ (Sum of 1–3)
- SCT Symptom Count ____________
BAARS-IV: Self-Report: Current Symptoms  (page 3 of 3)

Section 5

28. Did you experience *any* of these 27 symptoms at least “Often” or more frequently (Did you circle a 3 or a 4 above)?  **No**  **Yes**  (Circle one)

29. If so, how old were you when those symptoms began? (Fill in the blank)
   I was __________ years old.

30. If so, in which of these settings did those symptoms impair your functioning? Place a *check mark* (✓) next to all of the areas that apply to you.
   □ School
   □ Home
   □ Work
   □ Social Relationships
Clinical Diagnosis

- Obtain family history for ADHD, drug use, criminal behavior, etc.
- Rule out learning disability
  - referral for assessment
- Perform physical examination to eliminate medical causes
  - contraindications of stimulant therapy (CV risk factors)
- Use other rating scales
  - No validated adult rating scales to date
    - ASRS-v1.1, Achenback adult rating scales, Connors Adult ADHD Rating Scales, Brown Attention-Deficit Disorder Scale for Adults
  - Brain imaging is not recommended for diagnosing

Is this enough?

- Need to validate adult modified scales
- Modify inattention and hyperactivity symptoms in diagnostic material
- Track treatment response
- Simplify diagnosis for practitioner
Treatment

Goals and General Approach
Non-Pharmacologic Options
Pharmacological Options
Follow-up/Monitoring
Goals

• Minimize the impact of ADHD symptoms
  • enhance attention, improve academic performance, and improve working memory
• Maximize the patient's ability to compensate or cope with any remaining difficulties
  • treating comorbid conditions
• Partnership between HC team and patient
General Approach

- Treat the more severe comorbid disorder first
  - Severity and Timing
    - Chicken vs. Egg
  - Continue on to treat other comorbidities
- Non-Pharmacologic Therapy
  - ADHD education
- Pharmacotherapy
Non-Pharmacologic Therapy

ADHD Education

- Properties of ADHD
- Diagnosis
- Treatment Options
- Strategies for Successful Management
Non-Pharmacologic Therapy

Strategies for successful management

• Establish structure to help initiate, engage, and complete tasks
• Tools to assist them with organization
• Vocation and hobby choice
• Social support network
  • Community-based support groups
  • Cognitive Behavioral Therapy (CBT)
• Manage substance use
• Healthy lifestyle
Non-Pharmacologic Therapy
Cognitive Behavioral Therapy (CBT)

Structured short term approach to improve core ADHD symptoms through skill development

Modules consisting of...

- Organization and planning
- Problem-solving
- Distraction management
- Procrastination management
Cognitive behavioral therapy vs relaxation with educational support for medication-treated adults with ADHD and persistent symptoms: a randomized controlled trial

- 86 patients randomized to 12 individual sessions of either CBT or relaxation with educational support

- Primary outcome: ADHD symptoms rated by an assessor (ADHD rating scale and Clinical Global Impression scale) at baseline, post treatment, and follow-up (6 and 12 months)
- Secondary Outcome: self-report of ADHD symptoms

- Results
  - CBT achieved lower post treatment scores on both rating scales (CGIS P=0.03; ADHDRS P=0.02) compared to relaxation
  - CBT achieved lower self-reported symptoms (P<0.001) during and post treatment compared to relaxation and education

Non-Pharmacologic Therapy

Why initiate CBT

- Ineffective coping skills
- Repeated failed experiences and chronic under achievement
- Avoidance of coping efforts
  - comorbid disorders

When to initiate CBT

- In combination with pharmacotherapy
- Informed choice not to use medications
- Intolerant/adherence
- Comorbid conditions that could benefit
Pharmacologic Therapy

Should be considered 1st line with CBT for adults with ADHD with moderate or severe impairment

Prior to Initiation

- PMH of cardiac history
- Most studies focus on medication in children
  - Recent studies using adult patients
- Inform of psychological and physiological risks
Pharmacotherapy

Initiation

- Start low and titrate slow
- Maximize dose before substitute therapy
- Stimulants vs. placebo
  - Anti-depressants

Pharmacotherapy

D4 dopamine receptor gene (DRD4 7) react less strongly to dopamine

<table>

<td></td>
<td></td>
</tr>
</tbody>
</table>

Pharmacotherapy

Short-acting formulations

- supplemental dosing
- management of symptoms as-needed basis
- higher potential for diversion or abuse
- Patient satisfaction
  - 40-50% of patients reported satisfaction with IR medication vs. 70% with LA formulations

CV risk with Stimulants?
ADHD Medications and Risk of Serious Cardiovascular Events In Young and Middle-Aged Adults Study

- Retrospective, population-based cohort study
- Computerized health records from 4 study sites
  - 1986-2007
- Adults aged 25–64 years with dispensed prescriptions for methylphenidate, amphetamine, or atomoxetine (150,539 patients)
  - Each patient was matched to two non-users at each study site
- Primary Outcome
  - Serious cardiovascular events (MI, sudden cardiac death, or stroke.)
- Results
  - 806,182 person-years of follow-up
  - adjusted RR was 1.03 (95% CI, 0.86-1.24) for current vs. remote use
  - Current use of ADHD medications, compared with non-use or remote use, was not associated with an increased risk of serious cardiovascular events.

Monitoring

Patient Monitoring
Behavioral and functional goals
6-item ASRS
Any other self or clinical scales

Medication Monitoring
Adherence, effectiveness, side effects, adverse impact on sleep, behavior, appetite, and weight
Frequency

- Initially and while titrating
  - Every 3-4 weeks
- Every 3 months until stable
- Every 6 months once stable
Where do we go from here...

- Validate adult-specific criteria to more accurately describe and identify adult ADHD
- All initial mental health evaluations of adults should include screening for ADHD
- Improve education of adult ADHD
